33. Summary Statistics (All Households - Puerto Rico, 50 States, and District of Columbia, Total)

Introduction

This report presents the major findings of the Department of Agriculture's 1975 survey of the Characteristics of Food Stamp Households. The data reported were collected from case files of households certified as eligible for participation in the Food Stamp Program during September 1975.

The study is nationwide in scope. The statistical universe is the set of all case files of households certified eligible to participate in the Food Stamp Program in September 1975. The sampling plan called for 11,508 household records, and a total of 11,327 acceptable observations were obtained.

Highlights of Findings

The major findings are reported in detail for the 50 States and the District of Columbia. Because the distribution of important variables is quite different in Puerto Rico, the data for Puerto Rico are reported separately in chapter XIV.

1. The average total amount of deductions from gross income was \$77 per month for all households, an average of deductions for those which claimed a deduction and those which did not. About 83 percent of all households claimed some deduction; the average deduction for these households was \$93 per household.
2. For all households in which an elderly person (age 65 or over) resided, the average total deduction was \$46. Among those households with elderly persons which claimed a non-zero deduction, the average total deduction was \$62. Clearly, elderly households had smaller than average total deductions.
3. The average household size was 3.2 persons. One- and two-person households comprised 46 percent of all households.
4. The average gross monthly income for all households was \$298; the average net income was \$223.
5. Sixty-four percent of all households were headed by females. Their average household size was 3.0. Households headed by males had an average household size of 3.6.

6. There were 1 million elderly persons (age 65 or over) in the Food Stamp Program, about 6 percent of total participants. Although elderly people tended to live in small households, most small households did not have elderly members.

7. Of all households, 76.6 percent had non-working heads and reported no earned income, 15.4 percent had household heads working full time, and 4.5 percent had household heads working part time (less than 30 hours per week). Of all households, 3.5 percent reported income earned from a member who was not the head of the household.

Seventy-seven percent of households with the head between ages of 18 and 65 had non-working household heads. Among male-headed households in this group, 68 percent were non-working; for females, 82 percent. "Working" reflects an employment status indicated in welfare office files. It does not imply any official labor force definition.

8. Forty-two percent of all households received AFDC income (2.2 million households). Twenty-six percent of all households had only AFDC; 16 percent had another source of income in addition to AFDC.

9. There were 892,000 households with SSI income (17 percent of total households). Of the SSI recipients, 271,000 (30 percent) had no other source of income. Among all households which had SSI income, the household size averaged 2.0 persons. The average gross income for all SSI households was \$228; net income averaged \$193, reflecting smaller average deductions than non-SSI households.

10. Four hundred and twenty-nine thousand households received General Assistance (GA) income (8.2 percent of all households). Two hundred and ninety-four thousand (68 percent of GA's) had no other source of income. Among households with GA income the average gross income was \$225; net income was \$170 and average household size was 1.9 persons.

11. Two hundred and two thousand (or 1.3 percent) of the September 1975 food stamp population were students over 18 years of age. Of all households, 3.9 percent had students over age 18 in them. Their average household size was 1.1 persons, and 22 percent of them took the education deduction.

12. There was a wide dispersion of length of certification periods, with the median reported in the 6 to 9 month category.

13. Among households which had neither SSI nor AFDC income, the median value of reported assets was exactly \$0.

14. Converting Office of Management and Budget (OMB) annual poverty guidelines to monthly figures, about 77 percent of all food stamp households had gross incomes below the poverty levels in effect for September 1975. Thirteen percent had incomes between 100 and 125 percent of poverty, 5 percent fell between 125 and 150 percent, and 4 percent had gross incomes in excess of 150 percent of the poverty level.

Sampling Plan

In October 1975, data were collected by Food and Nutrition Service (FNS) field staff from household records in welfare offices across the country and in Puerto Rico. A total of 11,508 records were sampled, as well as backups, for households certified eligible for food stamps for September 1975.

Stratification Variables

While individual cases were selected in a random fashion in a project, the 273 projects were selected according to a sampling plan designed to insure a statistically valid sample for national inferences. Adequate representation was required from the many different types of counties, as well as persons, in the Food Stamp Program.

In the 50 States, each of the 25 major projects of 80,000 or more food stamp recipients was considered unique. Therefore, each was included in the sample. The remaining projects were then stratified regionally to insure good regional representation.

Within each region, projects were then categorized by each of the following criteria:

1. Urban, rural;
2. Public Assistance (PA) or Nonpublic Assistance (NPA) predominant;
3. Small, medium, or large.

"Urban" meant that, according to the 1970 Census, 50 percent or more of the project's entire population lived in an urban center; "rural" meant that less than 50 percent did. "PA predominant" meant that according to Food and Nutrition Service program data, 50 percent or more of the caseload in May 1975 was PA households; "NPA predominant" meant less than 50 percent was PA. "Small" projects contained less than 1,000 food stamp households in May 1975; "medium" had 1,000 to 5,000 households; "large" had more than 5,000 households (but less than 80,000 participants).

Puerto Rico

A separate sampling plan was developed for the nine projects in Puerto Rico. San Juan was considered unique and treated as a separate stratum, analogous to the largest U. S. projects. Of the eight remaining Puerto Rico projects, statistical specifications required a minimum of four projects to be sampled.

Sample Size

Data were gathered from 11,508 records to ensure at least 10,000 valid observations, allowing for about 10 percent loss due to invalid observations. Ten thousand observations were required not only to allow for valid national inferences, but also to provide some regional inferences if required. A total of 11,327 valid observations were obtained after careful editing. This large number of valid cases is the direct result of adequate backup procedures and special efforts

by FNS regional and field personnel. A listing by State of the number of observations in the survey is shown in table 1.

Survey Findings

Survey findings for the 50 States and the District of Columbia are summarized in chapters I through XIII.

Survey findings for Puerto Rico are summarized in chapter XIV.

Distribution by Household Size

Average = 3.2 Persons

	Percentage of All Households
1 and 2 Persons	46
3 and 4 Persons	31
5 and Over	23

I. Distribution by Household Size

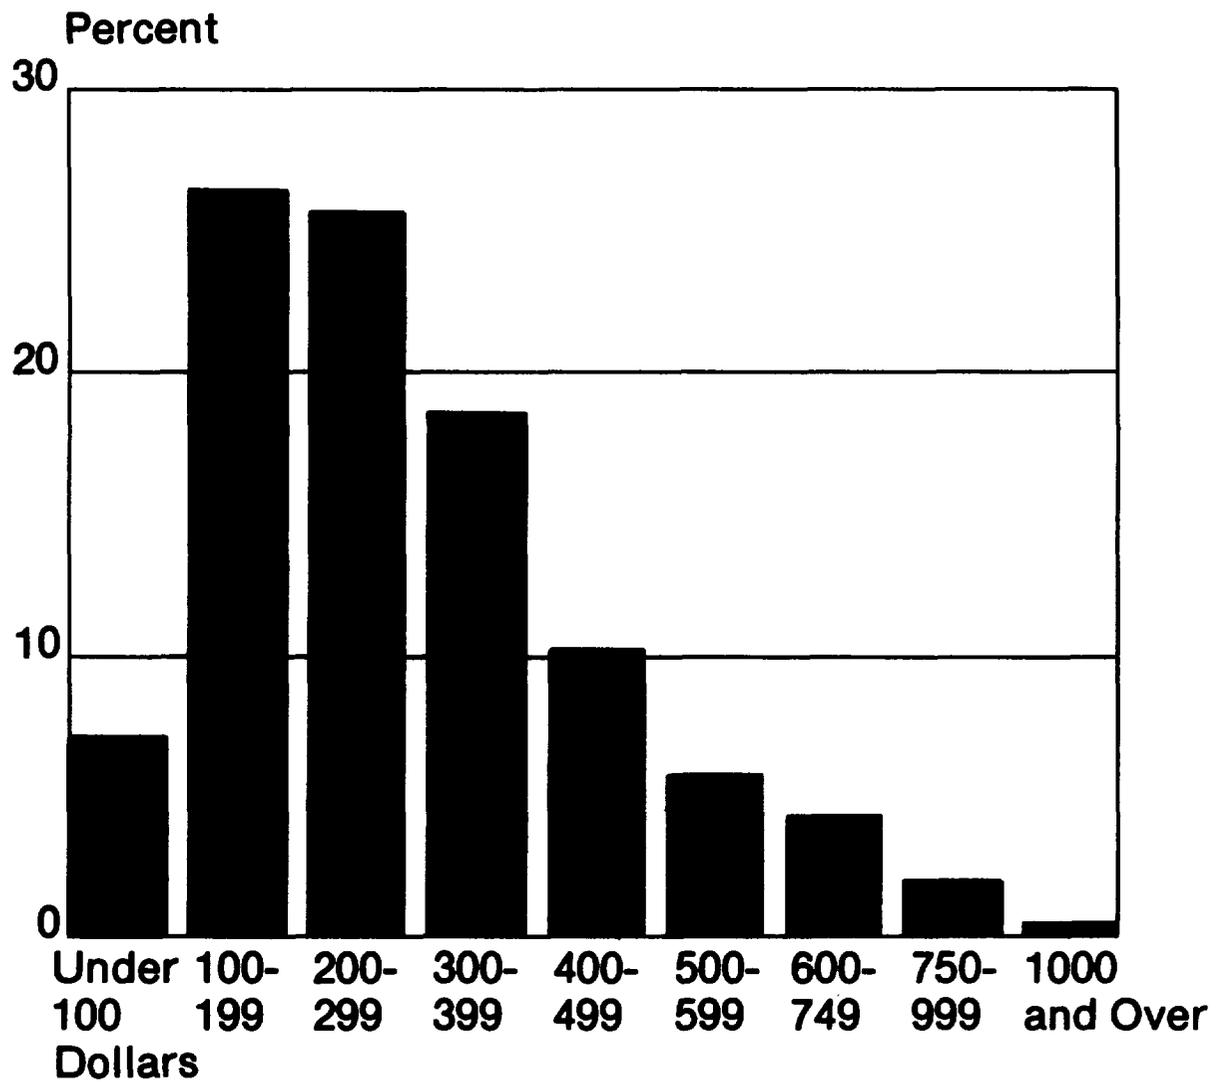

The average size of food stamp households was 3.2 persons. About 45 percent of all households were in the 1- and 2-person category. About 40 percent of all households fell in the 3- to 5-person range, and under 15 percent had 6 or more persons in the households.

The distribution of persons, rather than households, showed that about 20 percent of all persons lived in 1- or 2-person households, 50 percent lived in 3- to 5-person households, and 30 percent lived in households of 6 or more persons. These distributions are shown as border totals along the bottom of table 2.

Household size varied greatly depending on certain other characteristics of the household, as shown below.

<u>Household Characteristics</u>	<u>Average Size</u>
Female-headed households	3.0
Male-headed households	3.6
AFDC recipients	3.9
Elderly persons	1.7
Students	1.1

Distribution by Monthly Gross Income

II. Distribution of Gross Incomes

The average gross cash income from all sources for all households in the 50 States was \$298 per month.

About 80 percent of all households had gross incomes under \$420 per month, and nearly 19 percent fell in the \$420 to \$850 monthly range. The complete distribution of households by gross income and household size is shown in table 2.

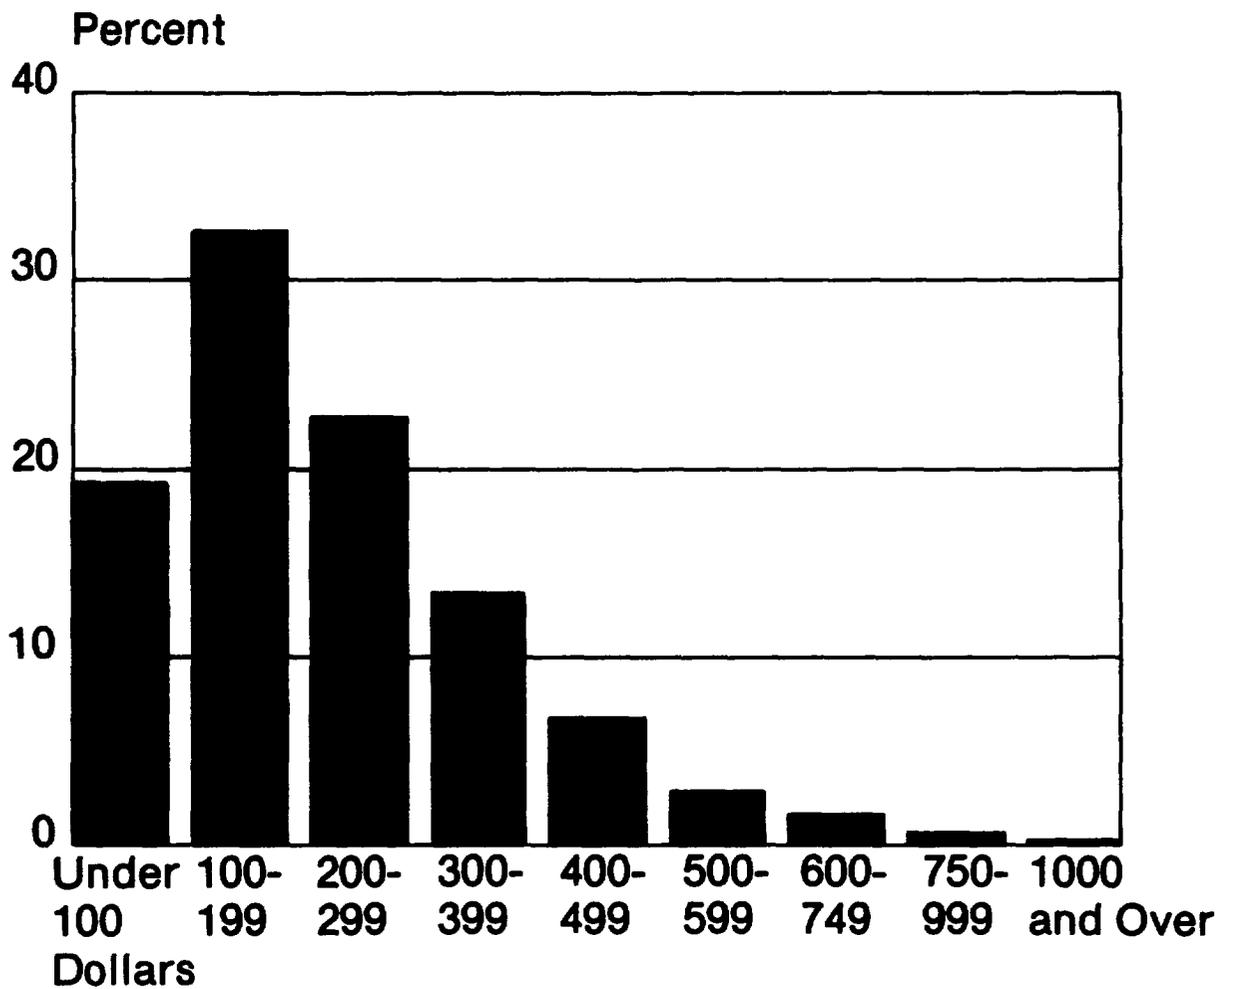

About 1.2 percent of all food stamp households had incomes over \$850 per month (61,000 households). Less than half of 1 percent (23,000 households) had over \$1,000 monthly income, and less than one-tenth of 1 percent (4,000 households) were in the \$1,250 a month and over income class.

It should be strongly emphasized that no inference about annual income can be drawn from these figures since the incomes of food stamp households vary greatly from month to month. Monthly income therefore is not an accurate indicator of annual income. Further, because many households participate for only a few months out of the year when they have suffered a loss of income, their income during the months they do not participate is irrelevant for food stamp purposes.

According to OMB poverty guidelines for September 1975, 77 percent of 4,041,000 households had incomes below the monthly poverty line for their household size. (For 4-person households the poverty level was calculated as one-twelfth of \$5,050 per year, or \$421 per month.) Thirteen percent, or 686,000 households, had gross incomes between 100 and 125 percent of the poverty level (\$412 to \$526 per month for 4-person households). Five percent, or 262,000, had incomes between 125 and 150 percent of poverty level (\$526 to \$631 per month for 4-person households). Four percent, or 228,000, were over 150 percent of the poverty level (over \$631 per month for 4-person households).

Considering poverty status by household size, 86 percent of 1-person households were below the poverty line, compared to 79 percent of the 8-person households.

Distribution by Monthly Net Income

III. Distribution of Net Incomes

The average net food stamp income was \$223 per month. Table 3 shows the distribution by net income and household size. In cases where deductions exceeded gross income, the net income was calculated to be zero rather than negative. Therefore, algebraically, total deductions will not always equal the difference between gross and net incomes, and the average difference of the two is somewhat smaller than the average of total deductions discussed later in this report.

Comparing net incomes on table 3 with gross incomes on table 2, the percentage of households in the zero income class was 1.6 percentage points higher when gross income is considered. Therefore, 1.6 percent of participants "deduct down" to the zero income level through itemized deductions.

The income class showing the largest difference between gross and net income was the \$.01 to \$99.99 class, which included only 4.1 percent of gross incomes but 14.6 percent of net incomes.

Income Sources

Source	Percentage of All Households
AFDC	42
Salaries	22
Social Security	21
“Other Income”	19
SSI	17
GA	8
VA	3
Roomer/Boarder	2
Self-Employment	1
Railroad Ret. and Other Pensions	*
Student Aid	*

* Less than 1 percent.

IV. Income Sources

A key to understanding who gets food stamps lies in the distribution of income sources. This section examines the sources and combinations of income received by food stamp households.

Among households relying on only one source of income, those with salary income had the highest average income--\$425 per month. Those who relied solely on payments from roomers or boarders in their household had the lowest average income -- \$120 per month. AFDC income was the highest average amount after income from salaries, although it amounted to only 64 percent of the average salary income.

Those few participants living solely on student aid were better off financially than those living solely on Social Security by about \$21 per month.

The average amount of "other income" from unspecified sources was substantial--\$280 per month, or only \$3 less than the average AFDC payment. While this "other" category includes unemployment compensation, it also includes a variety of income sources, many of which are the individual arrangements of the household.

Table 4 shows the sources of cash income of food stamp households. The number farthest to the left on each row shows the total number of households receiving the source of income for that row. The numbers to the right or directly above that number state the number

of households receiving a combination of income as indicated by the row and column headings. For example, 62,000 households had income from self-employment. Of them, less than 1,000 also received student aid; 10,000 also received AFDC; 2,000 also received GA income, and so on. While the individual cells of the table show the number of households receiving income from two sources--the row and column--those households may or may not have had additional sources of income.

Table 5A shows the income sources of food stamp households, the number and percentage of households receiving that income, and the average monthly amount of that income.

Table 5B shows the number of households with combinations of two and three specific sources of income. Tables 5A and 5B show that 62 percent of all households had only one source of income. Twenty-one percent had two sources of income in the specific combinations shown. Fourteen percent had some combination of two or more income sources that were not specified. Three percent reported no income whatsoever. The income combinations shown in these tables were purposely selected to show overlaps among transfer programs, and the combinations selected turned out to account for 86 percent of the income source combinations of food stamp households.

Rank Order of Income Sources

The most frequent source of income for food stamp households was from the Aid to Families with Dependent Children Program (42 percent of households). The least frequent source was student aid (0.8 percent of households). The various sources of income were:

1. AFDC (42 percent)
2. Salaries and Wages (22 percent)
3. Social Security (21 percent)
4. "Other" Income Sources (19 percent)--includes unemployment compensation, alimony and child support, contributions from relatives, etc.
5. SSI (17 percent)
6. General Assistance (8 percent)
7. Veterans Benefits (3 percent)
8. Payments from Roomers or Boarders (2 percent)
9. Self-Employment Income (1 percent)
10. Railroad Retirement or Other Pensions (0.9 percent)
11. Student Aid (0.8 percent)

Salaries, Wages, and Self-Employment Income

Twenty-three percent of all households reported earnings from salaries, wages, or self-employment. Their average earned income was \$361 a month. However, the average total income for these households, including unearned income, was \$450. About half of the households with earnings had no other source of income, but relied solely on their earnings, and the other half received some sort of transfer payment (tables 6A, B and C).

Of the households reporting wages, about 30 percent had AFDC as the second largest source of income. For these households, AFDC was an earnings supplement, with the AFDC grant averaging \$166 per month in addition to monthly earnings of \$328. Thus, their total income was on the average, \$518 per month.

Aid to Families with Dependent Children (AFDC)

Forty-two percent of food stamp households (2.2 million households) received AFDC benefits. Their average total income was \$339 a month, including an average AFDC grant of \$243 a month. About 60 percent of these AFDC households had no other source of income other than an average AFDC grant of \$283. Sixteen percent of the AFDC households (343,000) also had earnings from salaries and wages (in line with information reported under the AFDC program); 150,000 had Social Security income; 108,000 received SSI; and 318,000 had income other than that specifically listed on the survey form.

From this information it is clear that AFDC recipients constituted the largest clientele of the Food Stamp Program. This fact is not surprising since they are categorically eligible and have routine contacts with the welfare office.

General Assistance (GA)

Among all households, 8 percent (about 430,000) received general assistance grants. Their average total income was \$225, including \$165 of GA grant. About two-thirds of these households had no other source of income other than an average GA grant of \$190.

Supplemental Security Income (SSI)

Seventeen percent of the households received SSI; that is, about 892,000 aged, blind, and disabled households. Their average total income was \$228 a month, including \$119 of SSI. About half of them also received Social Security income, in which case their total income averaged \$232 a month, including \$74 in SSI and \$135 in Social Security. Only 30 percent of the SSI households had no income other than an average SSI grant of \$176 a month. Therefore, because they may not be subsisting solely on their SSI grant, there is potential for considerable month-to-month fluctuation in the income of SSI recipients.

Social Security

About 21 percent of all participants (1.1 million) had Social Security income, nearly as many as with earned income. The average Social Security payment was \$177 a month. Of those who had Social Security income, only one-third had no other source of income, with another 41 percent also receiving SSI, and 14 percent receiving AFDC.

Student Aid

Less than 1 percent of the households reported student aid. Forty percent of the households with student aid also showed salaries or wages; 18 percent had AFDC as an additional income source.

Veterans' Benefits

Three percent of the households received Veterans' Benefits. However, over 80 percent had a second source of income (Social Security for the majority of the veterans' assistance households).

Other Income Sources

About 3 percent of the households had income from boarders, railroad retirement, or other pensions. Almost 20 percent of all households showed "other income," which included gifts from relatives and unemployment compensation.

One-third of the households with "other income" received AFDC; 17 percent had salaries or wages; and 13 percent had Social Security.

Average Deductions

	Average Dollar Amount when Claimed	Percentage Households Claiming Deductions
Shelter	68	72.1
Work Allowance	24	22.4
Medical	41	18.8
Payroll	56	17.8
Child Care	82	2.9
Boarder Allotment	54	1.7
Education	74	1.6
Casualty	83	0.4
Alimony	98	0.4
Attendant Food Costs	46	0.2
Attendant Salaries	97	0.1
All Deductions	93	83

V. Deductions

Total Deductions

The total deduction for all food stamp households averaged \$77 per month.

The median was \$59 per month. Total deductions for a household are calculated as the sum of all deductions listed in the case file. In

some instances the amount of deductions exceeded the household's

The most frequently claimed deduction was shelter, and the least frequently claimed was that for a live-in attendant. Child care, casualty losses, and school fees were deducted by less than 3 percent of all participants. Some deductions benefited few households, but were substantial for those households who claimed them. For example, only 0.4 percent of households deducted alimony payments, although the average alimony deduction was \$98.

Shelter Deductions

The shelter deduction was the most commonly claimed deduction (72 percent of the households claimed it). The average shelter deduction for all households was \$49 a month; among households which claimed a shelter deduction, the average was \$68 a month. The array of shelter deductions by household size and income class is shown in table 9A for all households, and in table 9B for households claiming a shelter deduction. Table 9B also shows the frequency distribution of households claiming shelter deductions. There is a slight household size pattern to the shelter deductions. The chance of a household claiming this deduction tends to decline as household size increases.

The right-hand column on table 9B shows the incidence of the shelter deduction declining as income rises. This was as expected. The likelihood that a household would be eligible for the shelter deduction decreases as income rises, because shelter costs must exceed 30 percent of net income before they are deductible. Still, with the exception of the shelter deduction for zero gross-income households, those with higher gross incomes claimed the larger shelter deductions.

Shelter costs are shown on table 9G. Over two-thirds of all households paid under \$150 per month for all their shelter costs. Only 2.1 percent had shelter costs in excess of \$300 per month. Table 9H shows that 85 percent of all households paid less than \$300 a month in shelter costs and deducted less than \$100 a month for food stamp purposes.

Tables 9C and 9D show the average shelter deduction for all households, with and without elderly persons in the household. Table 9D shows that among households actually claiming the shelter deduction, the average for households with an elderly person was \$47 a month. When there were no elderly, the deduction averaged \$71 a month. Thus, it is shown that the elderly were not the participants with the larger shelter deductions.

Medical Deductions

Medical deductions averaged \$8 a month for all households and were the third most frequently claimed deductions. Among the 19 percent claiming the medical deduction, the average was \$41 a month. When there was an elderly household member, it averaged \$42. However, when there was no elderly household member the medical deduction averaged \$37 a month. Thus, the average medical deduction was slightly higher when the household included an elderly member.

Table 10A shows the average medical deduction increased consistently as income increased. This pattern is not peculiar, since higher income households may purchase more expensive, as well as preventive, medical care. Also, most lower income participants may not qualify for a deduction, because their medical expenses are paid through Medicaid or Medicare.

Mandatory Deductions

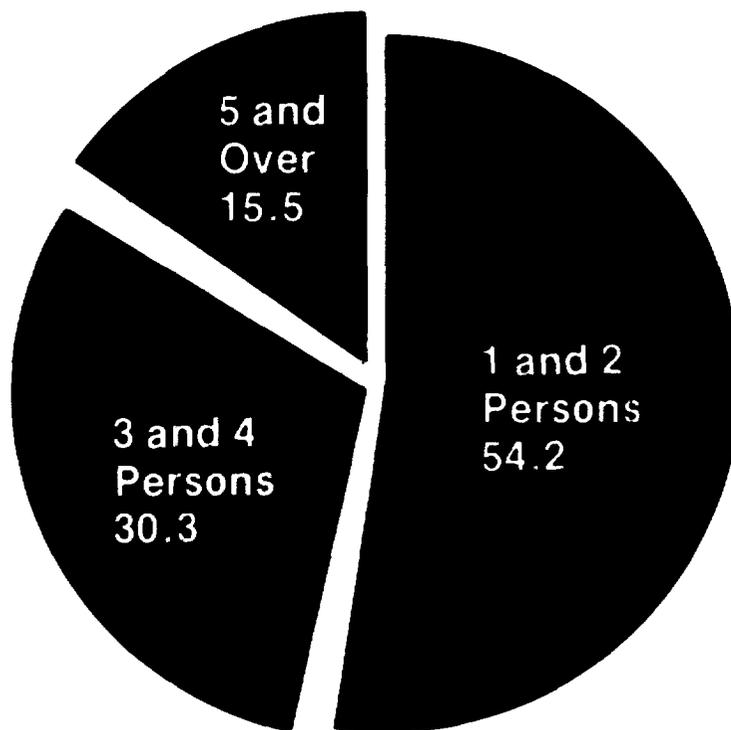

Mandatory payroll deductions averaged \$10 per month for all households (\$2 more than the overall medical deduction).

The average among the 17.8 percent of all households claiming the deduction was \$56 per month. The pattern over income groups and household size was as expected—the deduction increased with income, but generally decreased within a given income class as household size increased (tables 11A and 11B).

As discussed earlier, 22 percent of all participants had earned income. Since only 17.8 percent reported withholding deductions, a small percentage of households had either no withholding or were not taxed on their income.

Zero Net-Income Households

Percentage
by Household Size

241,000 Households

VI. Zero Net-Income Households

Over 240,000 households (5 percent) were certified as having zero net food stamp income. Therefore, these households have no purchase requirement and receive their allotments "free." About two-thirds of these households also showed zero gross income. Almost one-fourth of all zero net-income households were 1-person households with zero gross income.

Over 95 percent of the zero net-income households had total gross incomes under \$215 a month, which should be expected since the average monthly deduction was only \$77 a month. The complete distribution by household size and gross income is shown in table 20. Also, table 29 shows that the median certification period for these households was 1 to 2 months, consistent with FNS instructions that households having zero income be certified at that level only for short periods.

Table 20 also shows that one-half of one percent of the households with zero net income deducted over \$560 per month and, consequently, received their food stamps free; 4.2 percent deducted over \$215 monthly and received their stamps free. Therefore, the entire gross income of these few households was spent on deductible items. Taken as a percentage of the total caseload, 2 percent deducted their entire income.

Elderly

885,000 Households	(17 percent of total households)
1,000,000 Persons	(6 percent of total participants)
Average Deduction Claimed	\$46 per month
Average Household Size	1.7 persons
Median Specified Certification Period	10-12 months
Average Gross Income	\$223 per month
Average Net Income	\$178 per month

VII. The Elderly

Seventeen percent of food stamp households contained one or more elderly persons (age 65 or over), for a total of 1 million elderly participants. As shown in table 21, over 88 percent of the households with elderly persons were 1- and 2-person households. The average size of a household with an elderly member was 1.7 persons.

Table 22 shows the distribution of households by household size and elderly members. The subtotal line, in thousands, yields the percentage distribution of households with elderly, as shown in table 21.

Table 21 shows that while most households with elderly were 1- or 2-person households, only 42 percent of all 1-person households were composed of elderly persons (contrary to the belief that most 1-person households are elderly). Only 23 percent of all 2-person households had one or more elderly persons in them. Therefore, while elderly people tended to live in small households, small households were not predominantly elderly.

Of the entire caseload, 499,000 participants (3 percent) were elderly persons living alone. Of these 499,000 elderly persons, 419,000 were single elderly females. There were only 60,000 elderly persons heading households of three or more persons.

There were 285,000 household heads between age 60 and 65, or about 5 percent of all household heads. There were 775,000 household heads over age 65 (15 percent of all households). Therefore, 20 percent of all food stamp households were headed by a person over age 60.

Total Deductions of the Elderly

While the total monthly deduction for all households averaged \$77 per month, among households with one or more elderly members the total monthly deduction averaged \$46. Among households which did not include elderly members, the total deduction averaged \$84 a month. The distribution of average total deductions by income class is shown in table 23A for households with and without elderly members.

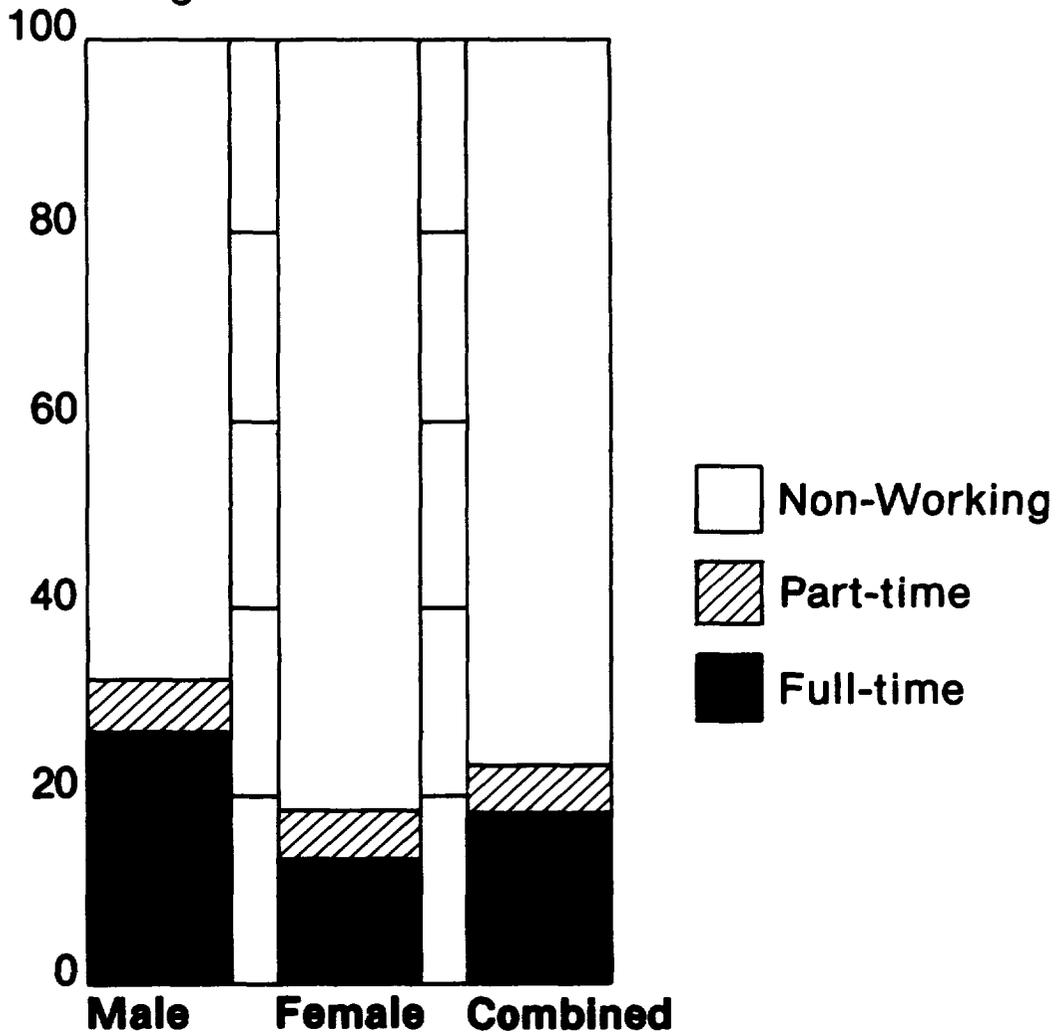

Seventy-four percent of households with one or more elderly persons claimed deductions, compared with the 83 percent of all households who claimed deductions. The deduction for elderly households claiming deductions averaged \$62 per month. Households with no elderly members claimed deductions 85 percent of the time, averaging \$99 a month. These distributions are shown in table 23B.

Work Status of the Elderly

Of household heads over age 65, 4.3 percent were working full or part time (33,000 persons). Another 70,000 household heads age 55-64 were working at least part time.

Work Status

Percentage
of Household Heads
18 through 65 Years
of Age

VIII. Work Status of Household Heads

Less than one-fourth of food stamp participants were working. ^{FULL OR PART-TIME} Among household heads age 18 to 65, 18 percent were working full time, 5 percent were working part time, and 77 percent were not working. As expected, the percentage of working males (32 percent) was much higher than the percentage of working female heads (18 percent) (table ~~24~~²⁵). We define "working" to mean simply that the household head had a paid job. It does not make any official employment-unemployment inferences, nor does it imply that homemakers, for example, do not work.

The detailed distribution of household heads by work status for all age groups is shown in table 25. About 20 percent of all households had working heads; 3.5 percent had non-working heads, but had earned income in the household. Three-fourths of all households had non-working heads and no earned income by any household member.

Twenty-six percent of working female heads of households were working less than 30 hours per week, while 18 percent of working male heads were working less than 30 hours. Overall, of those households with employed heads, 22 percent were employed less than full time. These findings indicate that the Food Stamp Program is only to a minor extent supplementing the income of the working poor.

While 18 percent of female heads of households were working, nearly 94 percent of all participating female household heads were exempt from the work registration requirements of the program (table 27B).

**22 percent
take education deduction**

IX. Students

The survey found that 202,000 (1.3 percent) of September 1975 participants were over 18 and enrolled at least half of the time in a college, university, or in an institution for technical training. Almost 4 percent of all households had one or more such students in them, and had an average size of 1.1 persons. Of the participating households with students, 22 percent claimed a deduction for educational fees.

New regulations limiting student participation were taking effect as of September 1975. Since the study sampled households certified eligible for that month, the impact of these September revisions would have been minimal. As of the close of the 1975-76 school year, there are probably fewer students participating in the Food Stamp Program due to these new regulations.

Age and Sex Distribution of Household Heads

X. Age and Sex of Household Heads

Female-Headed Households

Sixty-four percent of all households were headed by females. Half of female household heads were age 35 and under, 35 percent were 36 to 65, and 15 percent were over 65 (table 27A).

About 70 percent of participating female heads of households had children (or household members) age 18 or under. Forty-five percent had children 6 and under (tables 27B and 27C).

Under current work registration requirements, 2.3 million female household heads are exempt from the work registration requirements because they have children under age 18.

Slightly more households with 5 or more members were headed by females than by males--617,000 headed by females, compared with 585,000 headed by males.

There were 1.5 times as many non-elderly single female participants as there were non-elderly single male participants--481,000 and 312,000, respectively.

Male-Headed Households

Among the 36 percent of the households with male heads, 39 percent were age 35 and under, 46 percent were 36 to 65, and 15 percent were over 65. Male heads were somewhat older than female heads, with 50 percent under age 40; 50 percent of female heads were under age 35.

Sixty percent of the male-headed households had children (or household members) under 18; 38 percent had children 6 and under (as shown in tables 28A, 28B, and 28C).

**Median Certification
Period (When Specified)**

All Households 6-9 months

**Households Headed
by Elderly Persons 10-12 months**

XI. Certification Period

One of the most valuable topics on which data were collected is the length of certification periods.

Table 29 shows the distribution of certification periods by gross income. About 87 percent of the case records specified a certification period (including households recertified simultaneously for public assistance within a set length of time). Another 8.6 percent recertified for food stamps simultaneously with public assistance recertification, but within no specific time period. These cases are referred to as "indefinite" in tables 29 and 30. The "unknown" column refers to about 4.1 percent of the cases, where no information on length of the current certification was available in the case file.

In a very few cases, a 2-week certification period was specified (these were re-coded as 1 month). Certification periods of less than 1 month are specified when there is reason to believe a household's circumstances may soon change.

Among households with specified certification periods, the median certification period was 6 to 9 months. Households with gross income less than \$100 a month generally show short certification periods. With \$100 to \$359 monthly income most households had 6- to 9-month certification periods. Most of the households surveyed fell in this income class. At \$360 per month and above, certification lengths tended to decline, but with great variability.

Most of the "indefinite" and "unknown" households were in the \$100 to \$359 a month range.

The certification period pattern for elderly recipients was different, presumably the result of different income patterns. Table 30 shows the distribution by income class of the certification periods of households headed by elderly persons. The median period for those households with a specified certification period was 10 to 12 months.

Household Assets *

Households without Elderly Persons

Most have \$0 assets.
5 percent have assets over \$500.

Households with Elderly Persons

Most have \$0 assets.
13 percent have assets over \$500.
2.5 percent have assets over \$1500.

* Excludes the categorically eligible.

XII. Assets

The survey also attempted to measure assets owned by participating households. However, because of the definition of countable assets that pertains under the Food Stamp Program, certain items that would be of general interest, such as the value of an owned home, were not included in case files. Most of the assets recorded in the files and reported in the survey were bank accounts.

Since categorically eligible AFDC and SSI households are not required to pass the asset test, their case files do not always contain food stamp resource information. Therefore, inferences can only be made about the assets of the non-categorically eligible. The frequency distribution of assets for non-AFDC, non-SSI households is shown in table 31. Households of two or more persons, with at least one elderly member, currently have higher asset limitations than others. A breakdown by the presence or absence of at least one elderly person is also shown.

In each category, "zero assets" were the median and the mode of assets shown in the files. Among households with no elderly member, only 5 percent showed countable assets over \$500; for households with elderly, the figure was about 13 percent. Less than 2.5 percent of the households with an elderly member had reported assets over \$1,500. Household size seemed to have no effect on assets owned.

The frequency of "zero assets" may be due to two factors. First, certification workers may indicate "zero assets" for negligible amounts. Second, the bulk of participants may have no assets.

Average Household Purchase Requirement

Gross Monthly Income	Percentage of Gross Income
\$0	—
1-99	8
100-214	15
215-284	19
285-849	20-21
840-999	19
1000-1249	18
1250 +	13
All	19

XIII. Purchase Requirements

The average purchase requirement for all households was \$57, or 19.2 percent of the average gross monthly income. The breakdown of average purchase requirements, in dollars and as a percentage of gross monthly income, is reported by household size and gross income in table 32.

While the dollar purchase requirement rises with gross income for any given household size, deductions are highly correlated with income and drive the purchase requirement, as a percentage of gross income, downward as gross incomes increase. As shown on the table, the few 1-person households with gross incomes between \$560 and \$625 a month had such large itemized deductions that they were paying only 3.2 percent of their gross income for food. Similarly, the 4-person households with gross incomes over \$1,000 a month were paying no more than 12 percent of their incomes for food. However, a 4-person household at the current net income limit of \$553 per month paid, if they had no deductible expense, almost 20 percent of their income on food.

Across the income class rows, smaller households paid considerably smaller proportions of their gross income for their food stamps than larger households. For example, single persons with incomes between \$215 and \$284 a month paid 11.8 percent, while eight persons with the same income paid 23.7 percent. The difference is \$32 per month.
